1. Place the aluminum tubes on the floor. Connect the tubes together using the numbers on the frame. For example: 1 connects with 1, 2 with 2, etc.

2. Wrap the graphics around the frame and carefully pull both the corners. Make sure the fabric slides over the frame gently.

3. **Installing Optional LED Lights**
   Lift the frame halfway up and affix the Light Clips on top of the frame and screw it tight. Then slide the LED lights through the grooves.

4. Now stand the display upright, adjust the corners to ensure it’s standing straight, and your display is ready for action!

*Note: If the display does not stand straight, you can adjust the frame by having a person grab each side and gently shifting the top corners until the display stands fully upright.*
